

Greenhouse Gas Suite - UK™

Development Group

Industry collaboration for greenhouse gas information management associated with the UK Emissions Trading Scheme and the UK Climate Change Levy Agreements

What do you get?

Source Management Systems

- The system can incorporate support of extended company operations and is fully scalable to any number of sources and locations
- Each implementation can be delivered on the basis of the company's own internal organisation
- Web based data entry and capture is supported
- Standard software (Microsoft) means that systems easily interface with other existing systems, for example in energy management
- Modular construction means that sites, sources and new businesses can be incorporated or eliminated over time while maintaining information
- Transparency to audit and verification

Tracking and Rules Management

- The system comes with a library of protocols which will be generally available. In addition, users can incorporate their own protocols, where these are necessary
- Every calculation, factor, source characteristic and existence is date and time stamped. This enormously facilitates verification and also means that the system is robust to rule changes and their time of implementation.

Financial Management

- The system will also provide as standard reports on carbon valuation and trading position, as well as portfolio management measures, such as financial risk metrics
- Accounting, tax and management reports can be created as rules evolve.

Project Management

- The system provides a mechanism for monitoring progress on emissions reduction projects for internal compliance, both in terms of emissions and in financial terms
- As new rules emerge on how to enter the scheme through additional non-target related projects, the impact of these rules can be included

Report Management

- The system comes with a number of standard reports which are also capable of user adjustment for corporate needs
- These include reports on the baseline and tracking the baseline, and on performance against compliance targets
- Reports will also track allowances traded, including identifier codes, prices and delivery
- The emissions tracking and performance systems are based on ESP's existing ops*Environmental* software which is has been developed over 7 years and is used by over 50 Fortune 500 companies in the US

Best Practices

- The development group process itself will help companies determine best practices in a more efficient manner through collaboration
